I. PCA

Algorithm 1 PCA in Feature Spaces

- 1: **procedure** PCA(X)
 - 2: given n data: $\vec{x}^1, \vec{x}^2, \dots, \vec{x}^n$ to form the n by m input matrix: $X = [\vec{x}^1; \vec{x}^2; \dots; \vec{x}^n]^T$
 - 3: de-mean (or standardize) the input matrix: X
 - 4: calculate covariance matrix: $Cov = \frac{1}{n} X^T X$
 - 5: singular value decomposition (SVD) on covariance matrix: $U, S, V = svd(Cov)$
 - 6: choose the first k eigenvectors to form the m by k matrix: $E = [\vec{u}^1; \vec{u}^2; \dots; \vec{u}^k]$
 - 7: calculate the projection of any test data \vec{x} on eigenvectors: $\vec{p} = E^T \vec{x}$
 - 8: **output**
-

II. Kernel PCA

Algorithm 2 Kernel PCA

- 1: **procedure** K-PCA(X)
 - 2: given n data: $\vec{x}^1, \vec{x}^2, \dots, \vec{x}^n$ to form the n by m input matrix: $X = [\vec{x}^1; \vec{x}^2; \dots; \vec{x}^n]^T$
 - 3: calculate the n by n Kernel matrix K : $K_{ij} = k(\vec{x}^i, \vec{x}^j)$
 - 4: centralize K to get K' : $K' = K - I_n K/n - K I_n/n + I_n K I_n/n^2$
 - 5: solve equation: $n\lambda \vec{\alpha} = K' \vec{\alpha}$ to get the eigenvectors: $\vec{\alpha}^1, \vec{\alpha}^2, \dots, \vec{\alpha}^p$ and normalize them
 - 6: compute the projection of any test data \vec{x} : $\vec{p}_j = \sum_{i=1}^n \vec{\alpha}_i^j k(\vec{x}^i, \vec{x})$
 - 7: **output**
-
